1. Create a repo in GitHub desktop (IITR_CMLab)
2. Make UI file of this project on QT designer/creator inside our project directory (IITR_CMLab)
3. Put themes and images files in our project directory (IITR_CMLab)
4. Make a module directory inside (IITR_CMLab) directory for storing important .py files
5. Inside module directory put .py version of .ui file generated in step2. (.py version will be created in (IITR_CMLab) directory, cut and paste it to module directory).
6. Make a widget directory inside (IITR_CMLab) directory.
7. Now inside (IITR_CMLab) directory, make **main.py** file which will bind all the .py files present inside module directory, themes and images,widgets etc.
8. Make .exe file from main.py for executable version of our project

NOTES:

1. **PyCharm can be used as an IDE for this project. Make sure the directories like module and widgets are assigned namespace correctly inside PyCharm.**
2. Venv and .Idea are auto created files by Pycharm inside (IITR_CMLab) directory. It has nothing to do with our project

Important Images:

1. IDE Image: Focus on LHS for correct assignment of namespaces

2. Project directory Image (Local)
